

Decodability of six behavioural contrasts, layer-20 activations at the final prompt token

analysis population, n=216 scenarios (contrast subsets 81-216) · marker fill: filled = survives Holm on PR-AUC, open+dot = ROC only, open = neither · provisional single-judge labels

Six separate tests on overlapping case sets. Intervals are marginal, not simultaneous; no between-contrast comparison was performed and none is powered.

(a) thick bar = Hanley 95% CI, thin bar above = bootstrap 95% CI, grey tick = ROC permutation null. (b) open square = PR permutation null (the correct baseline); faint tick = class prevalence, which is NOT the PR chance level. n_perm=500, so ≤.012 is the resolution floor.
